Which GPS receiver should be used for a post-processed survey?

First-order, second-order, and third-order post processed GPS surveys require GPS receivers that are capable of recording data. When performing specific types of GPS surveys (i.e. static, fast-static, and kinematic), receivers and software shall be suitable for the specific survey as specified by the manufacturer.

What is a base station?

A base station is comprised of a GPS receiver, an antenna, and a tripod. The GPS receiver and the antenna shall be suitable for the specific survey as determined from the manufacturer's specifications. Tripod requirements are specified in Section 6B.3-3.

What is an independent baseline for a GPS survey?

For first-order and second-order GPS surveys, an independent baseline shall be produced between stations that are closer than 20 percent of the total distance between those stations traced along existing or new connections.

What is a total station survey system?

Total stations are always improving. As the equipment improves, new specifications will be developed and existing specifications will be changed. The TSSS is a system that includes a total station survey instrument and an electronic data collecting system. The system also includes tripods, tribrachs, prisms, targets and prism poles.

These Standards and Guidelines provide guidance to the Government cadastral surveyor and other land surveyors in the use of Global Positioning System (GPS) technology to perform ...

The FGCS standards and specifications have been modified to meet the specific needs and requirements for various types of first-order, second-order, third-order, and general-order GPS ...
