What is a stm32f105xx microcontroller?

Connectivity line devices are STM32F105xx and STM32F107xx microcontrollers. The device requires a 2.0 to 3.6 V operating voltage supply (VDD). An embedded regulator is used to supply the internal 1.8 V digital power. The real-time clock (RTC) and backup registers can be powered from the VBAT voltage when the main VDD supply is powered off.

What is a STM32F103 MCU used for?

The STM32F103 is a popular choice among electronics enthusiasts, hobbyists, and professionals due to its low power consumption, high performance, and rich peripheral set. This MCU is commonly used in various applications, including industrial automation, robotics, automotive, and consumer electronics.

What does STM32F103 stand for?

STMicroelectronics (ST) has developed the STM32F103 series chips with Cortex-M3 architecture. These chips have a 72MHz CPU main frequency and come with high-precision ADC, USART, CAN, USB, SDIO and other modules.
